6.17.1	Area Requiring Environmental Evaluation 66A	6-19

5.0 Transferable Property

Transferable property is property on which environmental contamination either never occurred or previously underwent remedial activities and has since been approved for NFA by the Army, EPA, and MADEP. A total of approximately 2,354 acres will be transferred. This property was either designated as CERFA-clean or CERFA-qualified during CERFA investigations; or, at one time, stored, released, or disposed of hazardous materials or petroleum products on site, but has since been considered noncontaminated. Buildings that contain asbestos, LBP, and radon were classified as CERFA-qualified because they are not regulated under CERCLA. Asbestos, LBP, radiation, and radon-contaminated buildings are classified as transferable, but hazardous substance notices must accompany the transfer. Any mitigation of asbestos, LBP, or radon that may be required will be the responsibility of the new property owners. A map of the North and Main Posts at Fort Devens illustrating transferable property is in a separate pocket at the end of this report (Figure 1-1).

5.1 Transferable Buildings

Table 5-1 lists all transferable buildings located on the Main and North Posts. The table does not include those buildings within the Reserve Enclave, or included in a previous EBS as identified in Section 1.0. Table 5-1 indicates the building number and description, and whether there are existing aboveground storage tanks (ASTs), ACM, ACM risk, LBP, or radon.

5.1.1 Buildings Containing Asbestos

Table 5-1 indicates whether ACM was found, assumed, or not detected within a building. The ACM risk column highlights those buildings with risk values of A or B as determined in the *Final Asbestos Report (AREE 65)* (Arthur D. Little, 1995b). These risk ratings, based on the USAEC Guidelines for Asbestos Hazard Assessments in U.S. Army Facilities, take into account a number of elements including: material friability, occupant accessibility to ACM fibers, activity/use, air stream/plenum, area of visible surface or damaged ACM, and population of occupied facilities. Risk level A indicates the need for immediate action to isolate the area, restrict access, and/or remove ACM. A risk value of B requires immediate initiation of an operations and maintenance (O&M) program and may restrict access to the area or require removal of ACM.

5.1.2 Buildings Containing Lead-Based Paint

Table 5-1 identifies whether LBP was found within buildings at levels that exceeded the Commonwealth of Massachusetts regulated lead standards. Only housing units within the historical district on the Main Post and seven buildings within the Buena Vista Housing Area were included in the LBP survey. Buildings not surveyed but constructed prior to 1978 were assumed to contain LBP.

5.1.3 Buildings Containing Radon

Table 5-1 indicates the level of radon in picoCuries per liter (pCi/L) present in a building. Structures with radon concentrations that exceeded 4 pCi/L were considered as containing elevated levels of radon in accordance with EPA action levels. As further described in the *Final Radon Survey Report (AREE 67)* (Arthur D. Little, 1994b), Table 5-1 also identifies structures that have radon concentrations that exceed 2 and 3 pCi/L.

5.1.4 Underground Storage Tanks

Table 5-2 lists all underground storage tanks (USTs), both existing and previously removed, associated with transferable buildings identified in Table 5-1. Demolished buildings are not included in Table 5-1. This table does not address USTs associated with buildings that are in the Reserve Enclave, covered by a previous EBS, or located in leasable parcels of land.

Table 5-2 also identifies which building the UST is associated with, whether the tank is in place or has been removed, the tank's capacity and fuel contents, and the status of the tank. The status column indicates whether the tank is active or inactive (not currently in use) for existing tanks, and the year of removal, if available, for all previously removed tanks. For further information regarding previously removed USTs, refer to the *Previously Removed Underground Storage Tank (AREE 63) Final Report, BRAC EE, Fort Devens, Massachusetts* (Arthur D. Little, 1995i).

5.1.5 Radiation Survey

The U.S. Army Center for Health Promotion and Preventative Medicine (CHPPM) is currently conducting radiation field investigations at specific buildings on the Main and North Posts. The field investigations were divided into three phases. Phase I of the investigations was completed in May 1995 and consisted of conducting radiation field investigations throughout buildings on both posts. Phase II of the radiation survey began during the fall of 1995 and was completed in 1996. Phase III of the radiation survey will begin in 1996 and continue into 1997. Both Phase II and III evaluate buildings not investigated in Phase I. At the time of transfer, the Phase III survey will not have been completed on 6 buildings included in the Basewide EBS (Table 5-3). Prior to occupancy by MGLB, the Army will complete this radiation survey and take necessary remediation actions on each building once the buildings are vacated.

5.2 Areas Requiring Environmental Evaluation and Study Areas Approved for No Further Action

Table 5-4 identifies all AREEs and SAs that have been approved for NFA by the Army and federal and state regulators. Table 5-5 identifies the CERCLA hazardous substances of concern prior to these sites being approved for NFA. These properties are, therefore, classified as transferable properties.

5.3 Area Requiring Environmental Evaluation 70 - Storm Sewer Systems

The AREE 70 study investigated 55 storm sewer systems on the Main and North Posts. The purpose of the study was to assist in identifying potential sources of contamination that were not previously identified as an SA, AOC, or AREE. All 55 systems draining major land areas of Fort Devens were sampled to identify contaminants that may be present above expected concentrations. The AREE 70 study found no new sources of contamination. However, 12 storm sewer systems were recommended for further investigation to clarify contaminant sources and provide more detail to ongoing site investigations. The data from the AREE 70 study is being used to support other site investigations (SIs) (i.e., SAs or AOCs) at Fort Devens. Systems number 1 through 9 are included in the Lower Cold Spring Brook SI and Systems Number 14, 21, and 25 are recommended for NFA. Table 5-6 lists the storm sewer systems either undergoing further action or recommended for NFA and awaiting approval. The table also identifies associated structures or land area associated with the storm sewer, and the SA, AOC, or AREE designation where the land parcel is found.
